ASHNIVA ADS

Product & Technical Guide

Poora flow, roles, har feature kaise kaam karta hai, aur aage ise kaise advance aur smooth bana sakte hain.

Version: Phases 0–4 complete · October 2026

Stack: Next.js 16 · Node.js (Express 5) · PostgreSQL (Prisma 7) · Redis (BullMQ) · TypeScript

Is guide me kya hai

1. Ashniva Ads kya hai
2. System ka big picture (architecture)
3. Data kaise organize hota hai
4. Roles aur permissions
5. User flows: signup se launch tak
6. Features kaise kaam karte hain (andar se)
7. Plans, billing aur limits
8. Ad platforms ka status
9. Security
10. Chalana aur go-live checklist
11. Aage kya advance kar sakte hain
12. Product ko aur smooth kaise banayein
13. Suggested roadmap

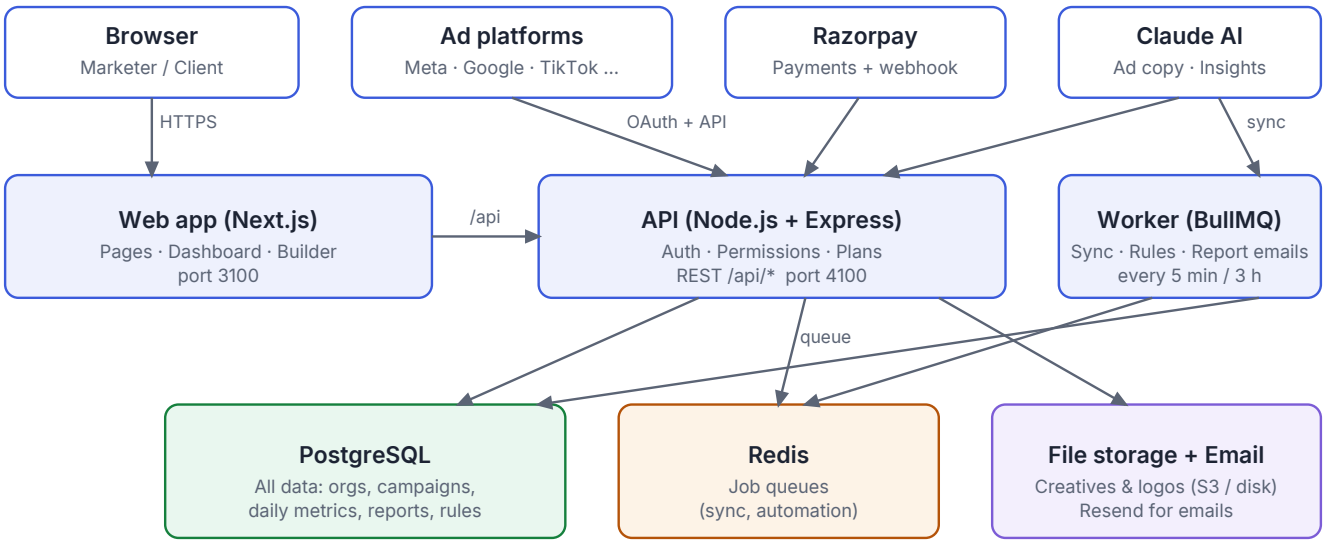

1. Ashniva Ads kya hai

Ashniva Ads ek **multi-tenant SaaS** hai jahan marketing team ya agency apne saare ad platforms (Meta, Google/YouTube, TikTok, LinkedIn, Microsoft, Snapchat, Pinterest) ek jagah connect karke ads **dekh, chala, bana aur report** kar sakti hai. Har customer company apna account khud banati hai; humara developer app ek hi baar platforms pe registered hota hai, aur customer sirf "Connect" dabakar apne ad accounts jod deta hai.

Problem (pehle)	Solution (Ashniva Ads me)
Har platform ka alag ads manager kholna padta tha	Ek dashboard: spend, revenue, ROAS, CPA saare platforms ka saath
Campaign har platform pe alag-alag banana	Campaign builder: ek baar banao, Meta + Google pe ek saath launch
Client reports Excel me haath se banana	Branded PDF/CSV reports, auto email schedule aur live share link
Raat ko bhi campaigns pe nazar rakhna	Automation rules: ROAS gire to pause, achha chale to budget badhao
Kisne kya badla pata nahi chalta	Activity log: har change ka who / what / when
Clients ko access dene me risk	Roles: Client sirf apna workspace dekh sakta hai, edit nahi

2. System ka big picture

Product 4 hisson me bata hai. **Web app** jo user dekhta hai, **API** jo har request check karke database se baat karta hai, **Worker** jo background me data sync, rules aur report emails chalata hai, aur **PostgreSQL + Redis** jahan data aur jobs rehte hain.

Shared packages: shared (types, plans, roles) · connectors (7 platforms + sample data) · core (sync, rules, reports, PDF, billing checks) · db (Prisma)

Code kahan kya hai (monorepo)

Folder	Kaam
apps/web	Next.js app: landing page, login/signup, dashboard, campaigns, builder, reports, automations, settings, admin, public report page
apps/api	Express REST API: auth, permissions, plan checks, saare /api/* routes, OAuth callback, Razorpay webhook, public API /api/v1
apps/worker	BullMQ worker: platform sync, har 3 ghante re-sync, har 5 min rules aur scheduled reports
packages/connectors	Har ad platform ka adapter (Meta, Google, TikTok, LinkedIn, Microsoft, Snapchat, Pinterest) + sample-data connector
packages/core	Shared business logic: sync engine, rules engine, report engine + PDF, campaign actions, plan limits, storage, email, encryption
packages/db	Prisma schema, migrations aur database client
packages/shared	Types, validation schemas, plans, roles, platform list, number formatting (web aur API dono use karte hain)

> **Connector pattern:** har platform ek hi interface follow karta hai (accounts list karo, campaigns/ad groups/ads lao, daily metrics lao, pause/activate, budget badlo, campaign banao). Isliye naya platform jodna matlab sirf ek naya folder likhna; baaki app wahi rehta hai.

3. Data kaise organize hota hai

Sab kuch **Organization** (customer company/agency) ke andar hota hai. Agency har client ke liye ek **Workspace** banati hai, aur ad accounts ko workspaces me assign karti hai. Ek login (connection) ke andar kai ad accounts ho sakte hain.

metrics_daily: har din × har campaign / ad group / ad ke liye ek row

impressions · clicks · spend · conversions · revenue · video views → CTR, CPC, CPA, ROAS yahin se calculate hote hain

Table	Kya store hota hai
users, sessions	Login, password hash (scrypt), refresh-token sessions
organizations	Company, plan, trial, subscription status, white-label branding
memberships	User kis org me hai aur kis role me; Manager/Analyst/Client ke liye workspace access list
workspaces	Client/brand ka space: currency, timezone
platform_connections	Ek platform login; OAuth tokens AES-256-GCM se encrypted; sync status
ad_accounts	Platform ke ad accounts; kis workspace me assigned hain
campaigns, ad_groups, ads	Platform ka structure: naam, status, budget, objective, targeting

Table	Kya store hota hai
metrics_daily	Har din ka performance data, teen levels pe (campaign, ad group, ad)
campaign_drafts, creatives	Builder ke drafts aur creative library ki files
reports, report_runs	Saved reports, email schedule, share link, bheje gaye emails ka log
rules, rule_runs, rule_targets	Automation rules, har run ki details, cooldown tracking
notifications, audit_logs	In-app alerts aur poora activity log
api_keys, sync_runs	Public API keys (sirf hash) aur har sync ka record

4. Roles aur permissions

Har user ka har organization me ek role hota hai. **Owner** aur **Admin** saare workspaces dekh sakte hain; **Manager, Analyst aur Client** sirf unhe assign kiye gaye workspaces dekhte hain. Har API request pe permission server pe check hoti hai, sirf UI me button chhupana kaafi nahi maana gaya.

Kaam	Owner	Admin	Manager	Analyst	Client
Dashboard, campaigns, reports dekhna	✓	✓	✓	✓	✓
Saare workspaces dekhna	✓	✓	Assigned	Assigned	Assigned
Campaign pause/activate, budget, builder se launch	✓	✓	✓	—	—
Creatives upload, automation rules banana	✓	✓	✓	—	—
Reports banana / schedule / share	✓	✓	✓	✓	—
Platforms connect karna, ad accounts assign	✓	✓	—	—	—
Team invite, roles badalna, workspaces banana	✓	✓	—	—	—
Branding, API keys, org naam	✓	✓	—	—	—
Activity log dekhna	✓	✓	—	—	—
Plan aur billing	✓	—	—	—	—
Team list dekhna	✓	✓	✓	✓	—

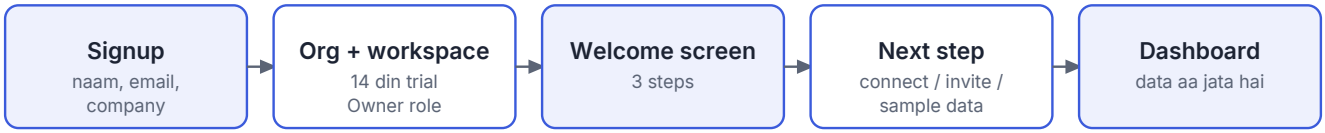

Ek aur level: Super Admin (aap, platform owner)

Ye kisi organization ka role nahi hai. **SUPER_ADMIN_EMAILS** me jo email ho, use **/admin** panel milta hai: MRR, saari organizations, plan badalna, trial extend karna, aur saare customers ke sync failures.

> **Data isolation:** har query organization aur workspace se scoped hai. Ek agency ka Client role apne workspace ke bahar ke ad accounts, connections ya team list nahi dekh sakta; ye API level pe test kiya gaya hai.

5. User flows: signup se launch tak

5.1 Signup aur onboarding

1. User **/signup** pe naam, work email, password aur company ka naam bharta hai.
2. API ek **user**, uski **organization** (plan: Trial, 14 din), **Owner membership** aur company ke naam se pehla **workspace** ek saath banata hai.
3. Login cookies set hoti hain aur user Overview pe pahunchta hai, jahan "Get started" screen 3 options deti hai: platform connect karo, team invite karo, ya **sample data** se explore karo.
4. Sample data dabane par 7 platforms ke realistic demo accounts bante hain aur worker unka data turant sync kar deta hai.

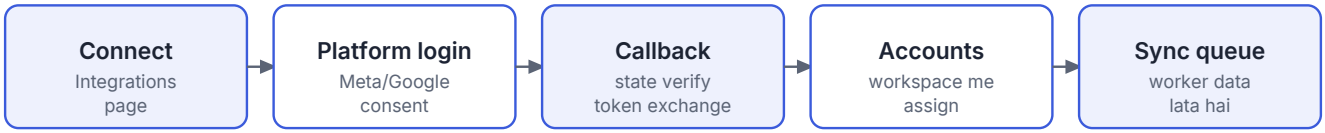

5.2 Login aur session

- Login par do httpOnly cookies milti hain: **access token** (15 minute) aur **refresh token** (30 din).
- Access token expire hone par web app chupchaap refresh kar leta hai; har refresh pe naya refresh token milta hai (rotation).
- Agar koi purana (chori hua) refresh token dobara use kare, us user ke **saare sessions band** ho jaate hain.
- Password reset ka link 1 ghante valid hota hai; reset ke baad har device se logout ho jata hai.

5.3 Team invite

1. Owner/Admin **Settings → Team → Invite** me email, role aur (Manager/Analyst/Client ke liye) workspaces chunta hai.
2. Invite email jaata hai (7 din valid). Plan ki member limit yahin check hoti hai.
3. Naya user link kholkar naam + password banata hai; pehle se account ho to login karke accept karta hai.
4. Membership ban jaati hai aur user ko sirf allowed workspaces dikhte hain.

5.4 Ad platform connect karna (OAuth)

1. User Integrations pe **Connect** dabata hai. API ek signed "state" banata hai (15 min valid) jisme org, user, workspace aur platform hote hain.
2. User platform ki login/consent screen pe permission deta hai.
3. Platform wapas **/api/oauth/<platform>/callback** pe bhejta hai. API state check karta hai aur ye bhi ki wahi user hai jisne shuru kiya tha.

4. Code ke badle access/refresh tokens milte hain, jo **encrypt karke** save hote hain. Phir us login ke saare ad accounts aate hain aur (plan limit me jagah ho to) current workspace me assign hote hain.
5. Sync job queue me jata hai aur user ko "Meta connected, 3 accounts found" jaisa message dikhta hai.

6. Features kaise kaam karte hain (andar se)

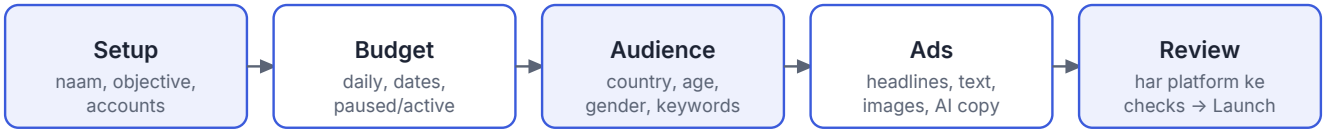

6.1 Data sync (Worker)

1. Pehli baar connect hone par pichhle **90 din** ka data aata hai; uske baad har sync me **last 7 din** dobara aate hain, kyunki platforms attribution ke baad purane numbers badalte hain.
2. Har **3 ghante** (SYNC_INTERVAL_MINUTES) worker saare active connections ko dobara sync karta hai. "Sync now" button se turant bhi chala sakte hain.
3. Pehle structure aata hai (campaign → ad group → ad), phir teen levels ka daily data **bulk upsert** hota hai. Platform pe delete hue campaigns "Removed" mark ho jaate hain.
4. Token expire hone wala ho to pehle refresh hota hai. Refresh na ho sake to connection "Expired" ho jata hai aur admins ko notification + email jata hai.
5. Jis org ka trial/plan khatam ho chuka hai, uska scheduled sync ruk jata hai.

6.2 Dashboard aur campaigns

- **Overview:** 8 KPI (pichhle barabar period se comparison), spend vs revenue chart (dual axis), platform-wise breakdown, top campaigns aur AI insights.
- **Campaigns:** saare platforms ek table me; filter, sort, search. Switch se pause/activate, budget pe click karke edit, multiple select karke bulk pause/activate.
- **Change ka flow:** UI turant update hota hai → API permission aur plan check karta hai → **pehle platform pe change** hota hai → phir database update → activity log me entry. Platform mana kare to UI wapas purani state pe aa jata hai aur reason dikhta hai.
- **Campaign detail:** us campaign ka chart, ad groups, ads aur uske saare changes ki history.

6.3 Campaign builder

- Har badlav **draft** me apne aap save hota hai (0.8 sec baad); Campaigns page pe drafts list dikhti hai.
- Character limits sabse strict chune hue platform ke hisaab se lagti hain (Google headline 30, description 90).
- Review step pe har ad account ke liye alag check hota hai (Meta ko Page, Sales/Leads ke liye Pixel aur image chahiye; Google ko 3 headlines, 2 descriptions aur keywords).
- **Meta:** campaign (CBO budget) → ad set (targeting, pixel) → har image ka ek ad. Image ek baar upload hoti hai aur uska hash cache hota hai. Beech me fail ho to adhoora campaign platform se delete kar diya jata hai.
- **Google:** budget, Search campaign, locations, ad group, keywords aur responsive search ad ek hi atomic request me banta hai: ya sab banega, ya kuch nahi.

- Default me campaign **Paused** banta hai taaki aap review kar sako. Ek platform fail ho to "Edit and retry" sirf failed wala dobara banata hai.

6.4 Creatives library

Images (PNG/JPG/WebP/GIF, 30 MB tak) aur videos (MP4/MOV/WebM) drag-and-drop se upload hote hain. Har image pe size se format badge lagta hai (1:1 Feed, 4:5, 9:16 Reels, 1.91:1 Link). Files local folder ya S3-compatible storage (AWS S3, Cloudflare R2) me jaati hain; random URLs hone se koi guess nahi kar sakta.

6.5 Reports

- **Builder:** metrics chuno, breakdown (campaign, platform, ad account ya din), period, platforms aur comparison; preview live update hota hai.
- **Export:** branded PDF (logo, colour, KPI tiles, chart, table, page numbers, ₹ formatting) aur CSV/Excel.
- **Schedule:** daily/weekly/monthly, workspace ke timezone me chuni hui time pe. Worker har 5 min due reports check karta hai aur PDF attach karke email bhejta hai.
- **Share link:** /r/<token> pe client bina login ke live report dekh sakta hai aur PDF download kar sakta hai; link kabhi bhi band kar sakte ho.

6.6 Automation rules

- **If:** ROAS, CPA, CPC, CTR, CPM, spend, clicks, impressions ya conversions par condition, pichhle 1/3/7/14/30 din ke data par.
- **Then:** pause, activate, budget % badhao (max cap ke saath) ya ghatao, team ko notify (optional email).
- **Scope:** saare campaigns, kuch platforms ya chune hue campaigns; minimum spend se kam data wale campaigns skip hote hain.
- **Preview matches** bina kuch badle dikhata hai kaun se campaigns match honge. Har run ka record (kaunse campaigns, values, action successful ya nahi) history me rehta hai.
- Rule ke kiye changes activity log me "via Rule: <naam>" ke saath dikhte hain.

6.7 Notifications

Header ke bell me rule matches aur expired integrations jaise alerts aate hain (har 60 sec refresh). Click karne par seedha related page khulta hai. Important alerts (expired access, email wale rules) email se bhi jaate hain.

6.8 White-label branding

Agency Settings → Branding me logo (PNG/JPG), brand colour, display naam aur footer set karti hai. Ye PDF reports, scheduled emails aur public share links pe lagta hai, taaki client ko agency ka brand dikhe.

6.9 AI assistant (Claude)

- **Write with AI** (builder me): product, audience, offer aur tone do; AI platform ki character limits ke andar headlines, descriptions aur primary text deta hai, jinme se aap chunte ho.
- **AI insights** (Overview pe): workspace ke last 30 din ke numbers (totals, platforms, top campaigns, pichhla period) ka summary bana kar Claude ko jata hai; wo 3–6 prioritized insights deta hai (opportunity, risk, info).
- Model **claude-opus-5-5** hai; structured output ki wajah se jawab hamesha fixed format me aata hai. Ek user ke liye 60 requests/ghanta ki limit hai. ANTHROPIC_API_KEY na ho to AI buttons chhup jaate hain.

6.10 Public API

Agency plan pe **Settings → API keys** se key banti hai (sirf ek baar dikhti hai, database me sirf hash save hota hai). Isse **/api/v1/workspaces**, **/campaigns** aur **/metrics** read kar sakte hain, jaise Looker Studio, Power BI ya data warehouse ke liye. Limit: 120 requests/minute per key. Docs: **/docs/api**.

6.11 Sample data mode

Real API approval aane tak demo ke liye ek sample connector hai jo 7 platforms ka realistic, har baar same data banata hai. Sample campaigns pe pause/budget/launch sab kaam karta hai, lekin changes sirf hamare database me hote hain, kisi platform pe nahi jaate. Integrations page se sample data hata bhi sakte ho.

7. Plans, billing aur limits

Plan	Price / month	Workspaces	Ad accounts	Members	Features
Free trial	₹0 (14 din)	5	15	10	Sab features
Starter	₹2,999	1	3	2	Campaign builder, on-demand reports
Growth	₹7,999	5	15	10	+ Scheduled reports, automation rules, AI
Agency	₹19,999	Unlimited	Unlimited	Unlimited	+ White-label, public API, priority support

Prices abhi placeholder hain, inhe **packages/shared/src/plans.ts** me badla ja sakta hai. Sample-data accounts limit me nahi gine jaate.

Limits aur lock kaise kaam karte hain

- Workspace banate, member invite karte aur ad account assign karte waqt plan limit check hoti hai. Limit cross ho to user ko "Upgrade" message aur **View plans** button milta hai.
- Jo feature plan me nahi (jaise Starter pe automation), wahan upgrade card dikhta hai.
- Trial khatam ho jaaye aur plan na liya ho, ya subscription cancel/expire ho jaaye, to org **read-only** ho jaati hai: data dikhta rehta hai, par changes, launches aur sync ruk jaate hain. Har page pe banner dikhta hai.

Razorpay payment flow

1. Owner Billing pe plan chunta hai → API Razorpay pe subscription banata hai.
2. Razorpay ka payment window khulta hai (UPI, card, netbanking).
3. Payment ke baad API signature verify karta hai aur plan turant active karta hai.
4. Renewal, failed payment ya cancel jaise baad ke events **webhook** se aate hain aur org ka status apne aap update hota hai. Cancel karne par current period ke end tak access rehta hai.

> Razorpay keys na hon to Billing pe "Talk to sales" dikhta hai, aur aap /admin se manually kisi bhi org ka plan set kar sakte ho.

8. Ad platforms ka status

Platform	Data sync	Pause / budget	Builder se launch	Status
Meta (FB + Insta)	✓	✓ (campaign budget)	✓ image ads	Code ready; Meta App Review chahiye
Google Ads + YouTube	✓	✓	✓ Search	Code ready; developer token chahiye
TikTok	✓	✓	—	Code docs se likha; real account pe verify karna hai
LinkedIn	✓	Pause ✓, budget campaign level pe	—	Real account pe verify karna hai
Microsoft (Bing)	✓	✓	—	Real account pe verify karna hai (sabse zyada dhyan)
Snapchat	✓	✓	—	Real account pe verify karna hai
Pinterest	✓	✓	—	Real account pe verify karna hai

Har platform ke liye developer app register karke uske credentials **.env** me daalne hote hain. Redirect URL hamesha **https://<domain>/api/oauth/<platform>/callback** hota hai. Credentials aate hi Integrations page pe Connect button chalu ho jata hai.

9. Security

- Passwords **scrypt** se hash; platform tokens **AES-256-GCM** se encrypted; API keys aur invite/reset tokens sirf hash ke roop me save.
- httpOnly cookies, short-lived access token, refresh rotation aur token chori pakadna.
- Har request pe server-side role, workspace access aur plan check; Client role ke liye data isolation test kiya gaya.
- Login, signup, password aur AI routes pe rate limiting; public API pe per-key limit.
- OAuth state signed aur 15 min valid; callback same user se hi complete hota hai.
- Razorpay checkout aur webhook dono ki signature verification.
- Har change ka audit log (kisne, kya, kab, kis IP se).

10. Chalana aur go-live checklist

Local pe chalana

Command	Kya karta hai
pnpm localdb:start	Project wala local Postgres shuru (port 5434). Restart ke baad ek baar chalana
pnpm dev	Web (3100), API (4100) aur worker ek saath
pnpm db:seed	Demo org + sample data + example report aur rule
pnpm build	Production builds

Demo login: **demo@ashniva.com / Demo@12345** (demo org Agency plan pe hai, aur local .env me ye super admin bhi hai).

Go-live se pehle

1. Meta App Review aur Google Ads developer token ke liye apply karo (ye sabse lamba kaam hai, hafton lagte hain).
2. Production domain, HTTPS, managed PostgreSQL (backups ke saath) aur managed Redis set karo.
3. RESEND_API_KEY (emails), S3/R2 (files), Razorpay keys + plans + webhook, ANTHROPIC_API_KEY (AI) daalo.
4. SUPER_ADMIN_EMAILS me apna email daalo aur demo admin hatao.
5. Privacy policy aur Terms ka legal review karwao (abhi draft hain).
6. Real accounts se saare connectors ek baar end-to-end test karo.

11. Aage kya advance kar sakte hain

Neeche wo cheezein hain jo product ko market me aur strong bana sakti hain, impact ke hisaab se group ki gayi hain.

11.1 Campaign management

Idea	Kya fayda
Meta video ads, carousel, dynamic creative	Builder se sabse popular ad formats ban sakenge
Google Performance Max, Display, YouTube video campaigns	Google ka poora inventory builder se
TikTok aur LinkedIn pe builder se launch	4 platforms ek click me
Ad set / ad group level edit (budget, targeting)	LinkedIn, TikTok jaise platforms ke budgets yahin se
Audience library (custom, lookalike, saved audiences)	Ek baar audience banao, har campaign me use karo
Bulk edit + campaign duplicate	Agencies ka bahut time bachega
Cross-platform budget optimizer	ROAS ke hisaab se budget automatically sahi platform pe shift

Idea	Kya fayda
Budget pacing alerts	Mahine ka budget jaldi ya der se khatam ho raha ho to warning
A/B testing workflow	Creatives aur copy ki structured testing

11.2 Data aur measurement

Idea	Kya fayda
Multi-currency conversion (daily FX rates)	USD aur INR accounts ka sahi combined total
GA4 + Shopify / WooCommerce integration	Platform ke dawe ke bajaye asli revenue se ROAS
Meta Conversions API / Google offline conversions	iOS ke baad bhi behtar tracking aur optimization
Meta Lead Ads / Google lead form sync + CRM push	Leads seedha sales team tak (Zoho, HubSpot, Sheets)
Hourly data (aaj ka live spend)	Din ke beech me fast decisions
Custom dashboards (drag-and-drop widgets)	Har client ke liye apna view
Google Sheets / Looker Studio connector	Clients apne tools me data dekh sakein

11.3 AI ko aur powerful banana

- **Ask your data:** chat me poochho "pichhle hafte kaunsa campaign sabse mehenga pada?" aur jawab chart ke saath.
- **Anomaly alerts:** spend achanak badhe ya conversions gire to AI turant alert kare, bina rule banaye.
- **Recommendations jo ek click me apply ho:** "is campaign ka budget 20% badhao" → Approve button.
- **Rule suggestions:** account ke data dekh kar AI khud useful automation rules suggest kare.
- **Creative scoring aur image generation:** kaun si image/copy behtar chalegi, aur naye variants banana.
- **Report summaries:** har scheduled report ke upar client ke liye 3-line AI summary, Hindi/English dono me.

11.4 Agency aur enterprise features

- **Client portal + custom domain** (reports.agency.com) aur custom email sender domain.
- **Approval workflow:** Manager campaign banaye, Admin/Client approve kare tab launch ho.
- **SSO (Google Workspace, Microsoft) aur 2FA**; enterprise ke liye SAML.
- **Ownership transfer, org delete aur data export** self-serve.
- Comments aur tasks campaigns pe (team collaboration).

11.5 Business aur growth

- **Stripe** international customers ke liye; **annual plans** discount ke saath; GST invoices auto-generate.
- Usage-based add-ons (extra ad accounts, extra AI credits).
- Referral / partner program aur white-label reseller plan.
- In-app onboarding checklist, product tours aur help center.

12. Product ko aur smooth kaise banayein

12.1 Speed aur feel

Kya karein	Asar
Polling ki jagah WebSockets / Server-Sent Events	Sync, notifications aur rule results bina refresh ke turant dikhenge
Daily/weekly pre-aggregated tables aur Redis cache	Bade accounts pe bhi dashboard 100 ms ke andar
metrics_daily ka monthly partitioning ya TimescaleDB	Saalon ka data hone par bhi fast queries
Virtualized tables (hazaron campaigns)	Badi agencies ke liye smooth scrolling
Saved filters, column chooser, URL me filters	Har user apna view rakh sake aur link share kare
Keyboard shortcuts (J/K navigation, P pause)	Power users ke liye tez kaam
Mobile app / PWA + push notifications	Phone se hi alerts aur quick pause
Hindi aur regional languages (i18n)	India me zyada users tak pahunch

12.2 Reliability aur engineering

- **Automated tests:** unit tests (rules, reports, plans), connector contract tests aur Playwright end-to-end tests.
- **CI/CD:** har push pe typecheck, lint, tests aur preview deploy.
- **Monitoring:** Sentry (errors), OpenTelemetry (traces), uptime checks, aur har customer ke sync health ke alerts.
- **Rate limits ke liye Redis store** taaki kai API servers ek saath chal sakein.
- **Platform API quotas ka smart handling:** per-account throttling, bade Meta accounts ke liye async insights jobs.
- Docker images, staging environment, daily database backups aur restore drill.

13. Suggested roadmap

Kab	Kya	Kyun
Abhi (0–1 mahina)	Meta/Google approvals, production deploy, Resend + Razorpay + S3 live, real accounts pe connectors verify, Sentry, basic tests	Bina iske paid customers nahi aa sakte
Agle 3 mahine	Multi-currency, Meta video/carousel, Google PMax, lead sync, WebSockets, onboarding tour, annual plans, approval workflow	Pehle 20–50 agencies ki zaroorat
3–6 mahine	AI chat + anomaly alerts + 1-click recommendations, client portal + custom domain, GA4/Shopify, budget optimizer, mobile PWA	Competition se alag dikhna aur price badhana
6 mahine+	TikTok/LinkedIn builder, audience library, Stripe international, SSO/SAML, partitioning/TimescaleDB, Hindi UI	Scale aur enterprise customers

> **Sabse zaroori agla kadam:** Meta App Review aur Google Ads developer token ke liye abhi apply karna. Product ka baaki kaam unke saath-saath chal sakta hai, lekin real customers unke bina connect nahi kar paayenge.
